

Internship Assignment

General Instructions

How will the output be measured?

- The output will be measured in terms of quality. While AI generates the bulk of the code today, it is still not perfect. Your code should be production-ready
- Logical clarity of the code built. You should be able to tell why a particular approach was used and why others were not suitable

Task Code Requirements:

- Use HTML, CSS, and Vanilla JavaScript only.
- External libraries, frameworks, and UI kits are not allowed.
- Ensure the code is clean, well-structured, and maintainable.

Note: The output of all the 3 tasks should be added on a dummy website created by you.

In case of any clarifying questions, please message the team

Task 1:

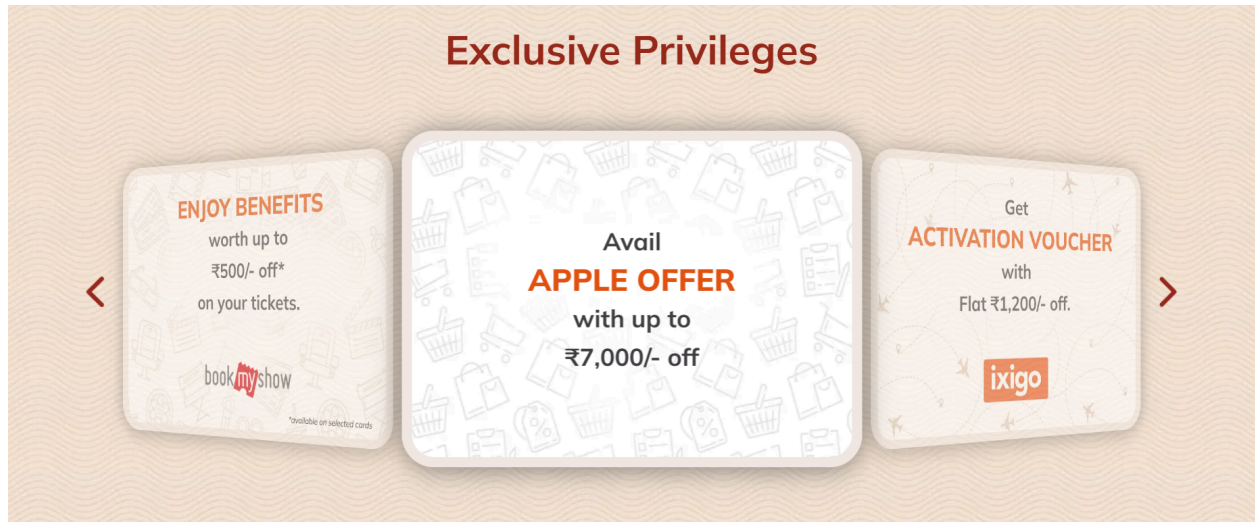

You are required to build the following sections using HTML/CSS/Javascript

Create a pixel-perfect replica of the "**Exclusive Privileges**" section from the following webpage:

<https://campaigns.icicibank.com/credit-card/noFee/index.html>

The replica should **exactly** match the original section in terms of:

- Layout and structure
- Styling and visual appearance
- Responsiveness
- Interactions and animations

Task 2: Video Chapters for a YouTube video.

Use html/css/javascript based code to do the following

- Create a carousel of the following videos
<https://www.youtube.com/watch?v=RJTCAL1DRro>
https://www.youtube.com/watch?v=jj_aUFX8SV8
<https://www.youtube.com/watch?v=xmmxkmVSiq0>
- Whichever video is playing, show suitable chapters in the video. For a long video, chapters are used to help users go to 'specific sections' of the video to save time

Post that, build an automated system to add chapters to a video. If a YouTube url is given as an input, it should automatically detect suitable points in the video and then create chapters and provide code.

Task 3: Form on a YouTube Video

For any YouTube video that is embedded on a website, you need to add a form that is shown 6 seconds after the video is played. The goal is to capture leads through the video (A user who has spent XX seconds watching a video is more likely to fill up a lead form for an advertiser). The experience should be smooth for the user.

You can use this video as an example and add a form to it after 6 seconds. The entire code needs to be added to a website and shown
